Report Title: Adding commenting Feature to CSE 3100 Project.

Theory: A commenting feature enhances user engagement by allowing visitors to share their thoughts, feedback, and experiences. This feature is essential for a cooking blog as it encourages readers to discuss recipes and share tips. This report outlines the implementation of a commenting system in a Django-powered cooking blog.

Implementation Steps

1. Define the Comment Model

Create a Comment model linked to the Post model to store user comments.

```
class Comment(models.Model):
    user = models.ForeignKey(User, on_delete=models.CASCADE)
    post = models.ForeignKey('Post', on_delete=models.CASCADE,
related_name='comments')
    content = models.TextField()
    created_at = models.DateTimeField(auto_now_add=True)

    def __str__(self):
        return 'Comment by {} on {}'.format(self.user.username, self.post.title)
```

2. Update Views to Handle Comments

Modify the view to process comments and display them alongside the corresponding post.

```
@login_required
def add_comment(request, post_id):
    post = get_object_or_404(Post, pk=post_id)
    if request.method == 'POST':
        content = request.POST.get('content')
        if content:
            Comment.objects.create(user=request.user, post=post, content=content)
            return redirect('DisplayPost', post_id=post.id) # Ensure 'display_post'
matches your URL name
        return HttpResponseForbidden("Invalid request.")
```

3. Create Templates for Comment Display

Modify the post_detail.html template to display comments and the form.

```
<div class="container vh100">
    <div class="row mt-5">
        <div class="col-lg-8">
            <h3>Comments</h3>
```

```

<!-- Display comments -->
<div class="comment-section mt-4">
  {% if comments %}
    {% for comment in comments %}
      <div class="comment mb-3">
        <p><strong>{{ comment.user.username
}}:</strong> {{ comment.content }}</p>
        <small class="text-muted">{{
comment.created_at }}</small>
      </div>
    {% endfor %}
  {% else %}
    <p>No comments yet. Be the first to comment!</p>
  {% endif %}
</div>

<!-- Add Comment Form -->
<form method="post" action="{% url 'AddComment' post.id %}"
class="mt-4">
  {% csrf_token %}
  <div class="form-group">
    <textarea name="content" class="form-control"
rows="4" placeholder="Write your comment here..." required></textarea>
  </div>
  <button type="submit" class="btn btn-primary">Post
Comment</button>
</form>
</div>
</div>

```

POST COMMENT

Conclusion

The commenting feature was successfully implemented, providing users with a way to interact with the cooking blog. This addition promotes engagement and builds a community around the blog content.
