Digital Skills Training for Students
Mid-Term Assessment

Track Name: PHP (Laravel)
Batch No.: RUETCSE0102
Student Name:

Marks: 20
Total Duration: 1:50 Hours
Obtained Marks: ____

Topic: Dynamic Library Management System

Instructions: You are tasked with extending the provided codebase of the Library Management Admin Panel to implement full database functionality. Follow the steps below carefully:

	Marks
1. Database Creation	3
- Create a database named LibraryManagement. - Within this database, create a table called Books with the following fields: id (Primary Key, Auto Increment, INT) title (VARCHAR, e.g., 'Data Structures') author (VARCHAR, e.g., 'John Doe') price (DECIMAL, e.g., '50.00') status (VARCHAR, e.g., 'Available', 'Issued')	
2. Database Connection	3
- Establish a connection between your codebase and the MySQL database using PHP. - Write a PHP file named dbconnect.php that contains the database connection logic.	
3. Add Dynamic CRUD Operations	6
- Modify the codebase to perform dynamic database operations: Add Books: - Update the "Add Book" page to insert new book records into the database table. Display Books: - Dynamically fetch and display the book records on the "Dashboard" page from the Books table. Update Books: - Update existing book details (<i>title, author, price, status</i>) from the "Update Book" page directly in the database. Delete Books: - Delete a book record from the "Delete Book" page by its id.	
4. Direct Actions from Dashboard	4
- Enhance the "Dashboard" page: - Add action buttons for Update and Delete for each row. - Clicking these buttons should lead to the respective functionality using the id of the book.	

- Create a basic login system:
 - Add a new table in the database named **Librarians** with fields: **id**, **username**, and **password**.
 - Add a *login.html* page where administrators can log in using their credentials.
 - Ensure secure password storage using hashing (e.g., `password_hash`).
 - Restrict access to the dashboard and other pages for unauthorized users.
-

Deliverables:

1. **Database SQL File:** Provide an SQL script to create the required tables and sample data.
2. **Updated Codebase:** Include all updated files (*AddBook.html*, *Dashboard.html*, *UpdateBook.html*, *DeleteBook.html*, *login.html*).
3. **Testing:** Ensure all functionalities (*CRUD operations*, *login*, *dynamic updates*) are fully operational.

THE END
